

Related Research for Taibah Events Application

1. Hadath Platform: Supporting Academic Event Management

Authors: Raad Alharthi, Rayyan Alyami, Abdullah Albogami, Faisal Almadi, Abdulwahab Alanzi, Mohammed Alshehri

Year: 2023

Source: [Publisher article page](#)

Abstract:

Hadath Platform is a Web-based application that allows the management of university events through sending students notifications, allowing them to register for an event, and providing them with information regarding the event in one single platform. The research relates to our project in the sense that information regarding the university events is spread in different places making it difficult for the students to find events that interest them.

Methodology / approach

Systematic development approach including requirement analysis, user-centric design, system architecture, and testing.

Key techniques / features

- Centralized event management
- Event discovery and registration
- Real-time notifications
- Analytics / event statistics
- Data Flow Diagrams and Sequence Diagrams

2. The Development of a Web Based UTHM Event Central Management System

Authors: Noril Atila Edi Putra, Rozanawati Darman

Year: 2025

Source: [Publisher article page](#)

Abstract:

This research presents a web-based central system for managing and promoting university events at UTHM. It addresses limited event visibility and fragmented communication channels. The system provides event search, notifications, and interactive event listings to make event information easier to access and improve student participation.

Relation to our project

This research is very similar to our Taibah Events Application project because both systems aim to collect university events in one centralized platform instead of having event information distributed across different channels. The UTHM system gives us an example of how events can be organized, searched, and displayed to students in one place.

Methodology / approach

Agile methodology, with iterative development and continuous stakeholder involvement.

Key techniques / features

- Machine Learning Recommendation Engine
- Participation Rate Prediction
- Automated notifications
- Analytics and reporting
- Role-based access

3. Campus Activities Management System with SMS Reminders

Authors: Rodel L. Aspa, Melba C. Ditché, James Andrew D. Atos, Maica D. Bagaporo, Josefina R. Sarmiento, PhD

Year: 2024

Source: [Publisher PDF](#)

Abstract:

This research presents a campus activities management system that allows organizers to manage events and students to browse and register for activities. The system includes automated SMS reminders for registered participants to reduce missed events and improve attendance. The study also evaluates the effect of the reminders on attendance and participant satisfaction.

Relation to our project

This research is related to our Taibah Events Application project because our system also includes event registration. After a student registers for an event, reminders can help them remember the event and avoid missing it.

Methodology / approach

Rapid Application Development (RAD): Requirements Planning, User Design, Rapid Construction, and Cutover.

Key techniques / features

- Automated SMS reminders
- Event scheduling and registration modules
- Participant tracking
- SMS notification generation
- Web and mobile accessibility

4. Smart Campus Event Hub: AI-Based Recommendations with Timetable-Aware Notifications

Authors: P. Saraswathi, Ch. Madhuri, D. Mythily, M. NagaLakshmi

Year: 2026

Source: [Publisher article page](#)

Abstract:

This research presents a smart campus event platform that uses students' interests, profiles, past interactions, and timetables to recommend suitable university events. The system considers students' available time to reduce scheduling conflicts and provides personalized notifications. It uses a recommendation module and AI components to improve event discovery and student engagement.

Relation to our project

This research could add a more personalized aspect to Taibah Events Application . Our project currently focuses on making university events easier to discover and access. The recommendation approach could allow the system to go one step further by suggesting events that are more relevant to each student.

Methodology / approach

Personalization and schedule-aware approach using student profiles, interests, past interactions, and academic timetables.

Key techniques / features

- Content-Based Recommendation
- Timetable Analysis
- Personalized / schedule-aware notifications
- Gamification: points, badges, and leaderboards
- Flask + SQLAlchemy with supporting AI components

Comparison of Related Systems

The comparison covers the capabilities described in the four studies and the planned requirements of the Taibah Events App.

Aspect	Hadath	Smart Campus Event Hub	UTHM	SMS Reminders System	Proposed System – Taibah Events App
Centralized Event Platform	Yes	Yes	Yes	Yes	Yes (planned)
Event Registration	Yes	No	Participant / secretariat registration	Yes	Registration and cancellation
Notifications	Real-time notifications	Schedule-aware email and in-app alerts	Automated alerts and reminders	Automated SMS reminders	University email confirmations, changes and reminders
Recommendation System	No	Content-based recommendation	Machine learning recommendation engine	No	No
Event Management	Create, edit and delete events	Event data and scheduling modules	Create, manage, promote and approve events	Create, update and delete events	College-scoped creation, editing, publishing and duplication
Analytics / Reporting	Event statistics and attendee feedback	No	Event analytics and reporting	Dashboard with information and metrics	University-wide analytics and attendance statistics
Role-Based Access	Attendee / organizer account types	No	Role-based student / administrator access	Administrator / authorized user functions	Student / staff / university administrator
Timetable Integration	No	Timetable analysis and free-slot matching	No	No	No
Attendance / Participation Support	Participation certificates and registered-event log	Points, badges and leaderboards	Participation tracking and e-certificates	Participant tracking and SMS reminders	Roster or QR check-in and participation history
Development Methodology	Requirements analysis, user-centered design and testing	No	Agile	Rapid Application Development (RAD)	No
